

1      Amendments to the Drawings

2      The attached sheet of drawings include changes to sheet 1,  
3      Figure 1B.

4      Attachment:    Replacement sheet 1 and Figure 1B.

5      Annotated sheet 1 and Figure 1B.

## REMARKS

2

3       The specification and claims were objected to for repeated  
4 smudges. Applicant requests reconsideration. Apparently, the  
5 scanning process at the PTO was defective. Applicant provides  
6 herewith a correct copy as filed and as a substitute specification,  
7 as desired.

8

9       Claims 1, 2, 4, and 5 were rejected as anticipated by Briseno,  
10 published 8/11/03. Claims 1, 2, 4, and 5 were rejected as  
11 anticipated by Pinto published 11-17-03. Claims 1, 2, 4, and 5 were  
12 rejected as anticipated by Yun published 8/3/03. Claims 1, 2, 4-8  
13 were rejected as anticipated by Liu published 2/3/03. Applicant  
14 requests reconsideration. Applicant published in the open  
15 literature a description of the invention on 12/13/02 in advance of  
16 filing the present application on 12/11/03 in J. AM. CHEM. SOC.  
17 2003, 125, 314-315, and hence, applicant swears behind these cited  
18 references.

19

20       Claim 3 was allowed but objected to as depending on a rejected  
21 base claim. Applicant requests reconsideration. New Claim 11  
22 includes the limitations of Claims 1 and 3. Claim 1 was amended to  
23 include the limitation that the nanofibers consist of a single  
24 polymer. New Claim 12 recites that the diameter of the fibers is  
25 less than 500 nm.

26

27

28

///

1       Claims 1, 2, 4-10 were rejected as unpatentable over Ko in  
2 view of Shiell. Claims 1, 2, and 4-10 were rejected as unpatentable  
3 over Lin in view of Marsoner. Applicant requests reconsideration.

4

5       The present specification teaches an interfacial process  
6 leading to the creation of small diameter, less than 500 nm,  
7 nanofibers consisting of single polymer that can be polyaniline in  
8 the preferred form. Ko does not teach a method of producing  
9 nanofibers having small diameters and consisting of single polymer.  
10 Ko teaches a process of creating a blend of polymer microfibers in  
11 the  $\geq 960$  nm range with very long lengths consistent with the  
12 electro-spinning process. Lin can produce 500 nm diameter  
13 nanofibers using an electrochemical process but cannot grow the  
14 nanofibers on the gaps between the conducting terminals. The  
15 counter electrode configuration of Lin and Marsoner will only work  
16 in solution and therefore is limited in application to solution  
17 sensing. Neither Ko nor Lin teach a process of producing small  
18 diameter nanofibers consisting of a single polymer and disposed as  
19 a film that bridges the gaps between conducting terminals. The  
20 processes of Ko and Lin, nor any combination of them, cannot be  
21 used to form the claimed sensor.

22

23       The examination states, respecting Ko, that "Varying these  
24 parameters to arrive at a film having these fiber properties would  
25 have required only routine skill in the art." This is incorrect.  
26 There is no information provided on how the Ko or Lin process could  
27 be changed nor are there any parameter variations that could be  
28 selected through this so-called routine skill. That is, there are

1 no possible parameter variations known that could be used by anyone  
2 skilled in the art using the Ko or Lin processes to arrive at the  
3 claimed single polymer nanofiber sensor.

4

5 By contradistinction, the Ko process is a blend process  
6 preferably using a 2% by weight blend of polyaniline polymers in  
7 the electro-spinning process to create large and very long  
8 microfibers. There are no teachings in Ko on how to make nanofibers  
9 from a single polymer suitable for disposition on electrodes of a  
10 sensor. Ko teaches making  $\geq$  960 nm microfibers from a blend of  
11 polymers in an electro-spinning process. Ko may obtain 10 micron  
12 sized polyaniline fibers, but there is no indication that such  
13 would be suitable for a sensor, the discovery of the present  
14 invention. Neither Lin nor Mosner teach a process of making a film  
15 bridging the gaps between the electrodes. There is certainly no  
16 suggestion in Ko or Lin or Mosner on how to change their explicit  
17 processes, contrary to their teachings, for generating the claimed  
18 sensor having nanofibers of a single polymer disposed over gaps  
19 between the electrodes.

20

21

22

23

24

25

26

27

28

///

1       The cited references do not teach a sensor made of nanofibers  
2 consisting of a single polymer and disposed between electrodes, nor  
3 any suitable method of making the polyaniline nanofibers in a  
4 sensor. Applicant requests allowance of all the claims.
